Troyer Haskell Tunnel Trap

Installing the trap is quick and simple.

Step 1) Familiarize yourself with the interior wire receiver located inside the tunnel by placing your hand inside the entrance and with your index finger locate the wire receiver. Place your index finger under the receiver. Your finger will guide the wire directly into the receiver hole.

If the trap is used without an already built sparrow nest, fasten a few pieces of nest material to rubber band.

Step 2) Insert your trip wire into any Troyer Gourd with a Troyer Tunnel by inserting the trip wire in from the access port.

Step 3) Place the wire into the tunnels trip wire receiver hole. Push the wire thru the receiver hole till its out the front, far enough until it can hold the trap door shutter.

Step 4) Slide the shutter over the square edges of the tunnel's front from the top down. The trap door shutter will rest upon the wire. (See photo above)

IMPORTANT!

Always be diligent when trapping birds. You will want to monitor the trap to be sure that no native species become harmed or stressed while trapped. To help you remember that you have set the trap, use a wind up kitchen timer or any other alarm system that will remind you and set it for 15 minutes. When the bell rings it will remind you to check your traps!

When the trap door is in the down position the bird is trapped. Lower your rack. Use a large clear plastic bag over the tunnel entrance, then lift the trap door. Tap the gourd, or carefully insert your hand into the gourd thru the access door. This should scare the birds into the bag. Often 2 sparrows are caught in one setting, so don't drop the bag too quickly, before you are sure you have all the birds in your bag.
